## OPERATION

## General

The drive of a synchronous motor is converted into linear motion of the actuator stem via a spur gear transmission. The actuator stem is connected with the valve stem by a buttonkeyed retainer connection.
An integrated spring package limits the stem force to a fac-tory-set value in either direction.
The actuator switches off precisely when the specified stem force is reached.

## Manual Operation

Actuators without spring return are equipped with a manual operation knob used in case of power failure. Manual operation is permitted only after the power supply is switched off or disconnected.
To operate, push the manual operation knob down and turn clockwise to move the stem downward and counterclockwise to move the stem upward. If the actuator returns to automatic control, the manual operation knob unlocks automatically.

## Override Option

All actuators have an integrated override function (see wring). When the override signal is applied, the actuator drives to the fully-open or fully-closed position, regardless of the controller signal.

## Electrical Installation

The actuators are delivered with a pre-installed cable gland M20 and two additional knock-outs for M18 and M20.
Max. cable length/diameter for field mounting: $200 \mathrm{~m} / 1.5 \mathrm{~mm}^{2}$
NOTE: To avoid malfunction, it is necessary to connect 24 Vac power and ground (see wiring).

## Go into self-adaption mode

Mount the actuator on the valve and electrified.
Press down W2 and W3 at the same time more than 2 s , then LED begin to flash, and actuator go into self-adaption process. The actuator will work one whole stroke automatically, then the LED stops flashing and self-adaption completed. The actuator will return to the position before self-adaption process.
NOTE: Self-adaption mode needs to be manually got into which will work only one whole stroke of the actuator.

## Input Signal Range

The range of the analog input signal $Y$ can be changed by pressing the right-hand pushbutton (W2) located on the printed circuit board (see Fig. 1). If the corresponding LED is lit, this indicates that the actuator is set for $0 \ldots 10 \mathrm{~V}$ operation (factory setting); if it is dark, the actuator is set for $2 \ldots 10 \mathrm{~V}$ operation.

## Input Signal Failure

Using the potentiometer (W1) located on the printed circuit board (see Fig. 1), the actuator can be adjusted such that in case of a signal input failure (e.g. a broken wire), the actuator will run to any pre-configured position between $0 \%$ and $100 \%$. The factory setting is with the actuator stem in the central position (50\%).
NOTE: The two pushbuttons (W3 and W2) and the potentiometer (W1) are accessible after the cover has been removed and are located at the rear side of the protection sheet of the printed circuit board.
