

KITZ

XJ Series Aluminum Butterfly Valves

KITZ CORPORATION

Aluminum Butterfly Valves

XJ Series

KITZ XJ Series aluminum butterfly valves : Featured with unique interchangeability of the neck designs (U.S.P. No.6676109) , for accommodation of various piping designs, piping positions and installation environments.

Neckless

Short Neck

Long Neck

Three neck designs for your choice :

Long neck type, short neck type and neckless type are available for versatile applications. Optionally available **Neck Mounting Kits** enable easy change of valve necks to other types, depending on service conditions. (Valves need to be dismantled from pipelines for neck replacement.)

Easy valve-to-flange centering :

Light weight of die-cast aluminum valve body (which is only one-thirds of KITZ's conventional cast iron butterfly valves) eases valve-to-flange centering work on mounting valves on pipelines.

Wide range of service applications :

Austenitic stainless steel discs and EPDM rubber seats can handle many different kinds of line fluid without concern of corrosion.

Stabilized operating torque :

A pair of stem bearing assembled around the top and bottom stems prevents stem galling, and stabilizes valve operating torque for smooth and trouble-free disc rotation.

On-the-spot actuator assembly :

The actuator mounting pads of all necks are designed in conformity with ISO 5211 requirements for direct on-site mounting of actuators which are provided with ISO 5211 valve mounting flanges.

Prevention of dew condensation (Long neck type) :

A long stainless steel neck blocks transfer of the fluid heat to a valve operating device, which thus needs no insulation. Dew condensation is minimized also in case of cold water service.

Rust prevention :

Main parts such as stems, discs, necks, neck connectors and endplates, and small parts such as stopper plates, washers and boltings are all made of stainless steel for highly graded rust prevention.

S-shape spherical disc for high sealing performance (patented) :

KITZ's original cross-sectionally S-shaped valve discs with spherical surface evenly make tight contact with rubber liners for excellent sealing performance with reduced operating torque. Thorough 360° shut-off mechanism helps extend service life of rubber liners.

SADG12

Long Neck Type
Prevented dew condensation

- A long stainless steel neck reduces conductivity of the fluid heat for prevention of dew condensation.
- Availability of valve body and neck insulation.
- Choice of actuators for automated valve operation.

Applications:

- Building utilities .
- Piping networks for cold water, hot water and other water supply.

Short Neck Type
Compact design

- Suitable for piping in a limited space.
- Choice of actuators for automated valve operation.

Applications:

- Building utilities.
- Plant facilities.
- Water treatment service.
- Operation of industrial machineries.

Neckless Type
Built-in operation mechanism
(Driven with a socket wrench)

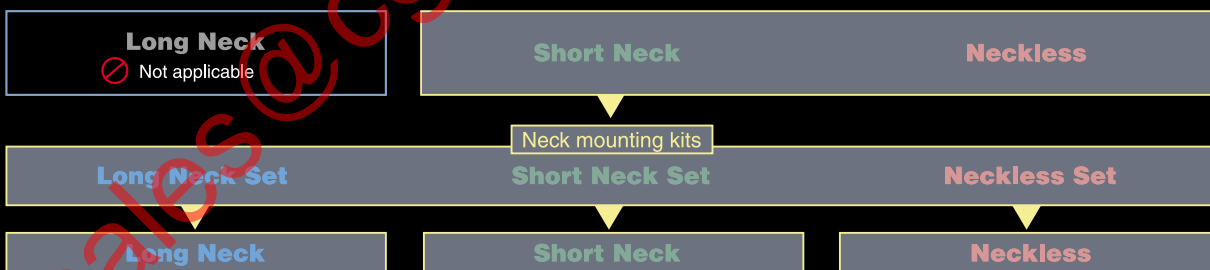

- Suitable for less frequent on-off operation.
- Suitable for piping in a limited space.
- Availability of valve body insulation.
- Prevention of unauthorized and unintentional operation.

Applications:

- Building utilities.
- Plant facilities.
- Water treatment service.
- Operation of industrial machineries.

Neck mounting kits are optionally available for easy change of neck designs (U.S.P. No.6676109), depending on desired service conditions. Detailed information is available on contact to KITZ Corporation.

Elaborately designed KITZ EPDM seats are featured with the following uniqueness for functional stability, high sealing performance and long life cycle:

- Self-reinforcing dual back-ribs
- Wider disc seating contact
- Dual stem seal bearings

- ① Wider disc seating contact for high sealing performance.
- ② Dual reinforcing back-ribs to minimize valve operating problems such as distortion, skidding and exfoliation of rubber liners caused by line pressure load and friction with metal discs.
- ③ Stem seal bearings are assembled on top and bottom stems for stabilized sealing function.
- ④ Gasketless flange sealing contact for easy valve mounting.

P-T Rating

Note : Contact KITZ corporation for technical advice when service conditions may exceed the P-T rating range limited here.

Pressure Loss (for handling static clean water)

Material

Parts	Material
Body	Aluminum Die-cast / Equivalent ASTM B85-84-383.0
Neck	A351 Gr. CF8
Stem	(Equivalent ASTM A276 Type 410)
Disc	A351 Gr. CF8M
O-ring	EPDM
Rubber seat	EPDM
Bottom stem	(Equivalent ASTM A276 Type 410)
Bearing	Metal Backed PTFE (Size 1½", 10" and 12") Polyphenylenesulfide (10XJMEA : Size 2" to 8") Bronze : CAC401C (PN16XJME : Size 2" to 8")

Dew Condensation Test

Samples of KITZ XJ Series butterfly valves equipped with long necks (KITZ Product Code : G-10XJMEA) were tested at KITZ laboratory under the conditions introduced below. Lower surface temperature of gear boxes, atmospheric temperatures and atmospheric humidities were measured as the variable functions. The dew condensations boundary was estimated as illustrated below.

Test condition :

Line fluid : +5°C cold water
 Atmospheric temperature : +20°C to +40°C
 Valve insulation : 50mm glass wool (JIS A 9501) around the test valve with gear boxes exposed to the open air.

Note:

The estimation introduced here is a result of summary of the tests carried out within a test basin provided with constant temperature and humidity, and does not necessarily represent absolute values. Note that dew condensation preventative property of these valves may be affected by change of test environments such as extent of air transfer and variation of line fluid temperature, atmospheric humidity or condition of insulation. Thus, acceptance of allowance of $\pm 5\%$ over the boundary area is recommended.

Valve Insulation

Areas in blue are recommended to insulate

Long Neck Type (G-10XJMEA)

Neckless Type (N-10XJSME)

Corrosion Resistance Level

This table indicates general corrosion resistance level of the materials of discs and rubber liners used for KITZ XJ Series butterfly valves against typical line fluids. The data is based on the laboratory test finding on **material test specimens** (not valve component test specimens) under constantly controlled test conditions, and thus each data may be subject to variation, depending on actual valve service conditions in the field. Please contact KITZ Corporation for technical advice, if service conditions are extra-ordinarily severe, or you have any doubt about corrosion resistance level of valves on-site. Also please contact KITZ Corporation when valves are used for hot water service.

Operation of Neckless Type Valves

No operation device is included for neckless type version.
Use a socket wrench to open or close valves according to the following instructions.

Operating procedure

- 1 Disassemble an indicator from the top of a valve.
- 2 Apply a socket wrench on a hexagonal connector and push it down to unlock it.
- 3 Open or close the valve.
- 4 At the full open or closed position, the hexagonal connector rises and gets locked automatically.
- 5 Remove the socket wrench and mount the indicator.

Indicator

Hexagonal Connector

Socket wrench

CAUTION

Do not apply an excessive load on the indicator to protect it from damage or malfunction.

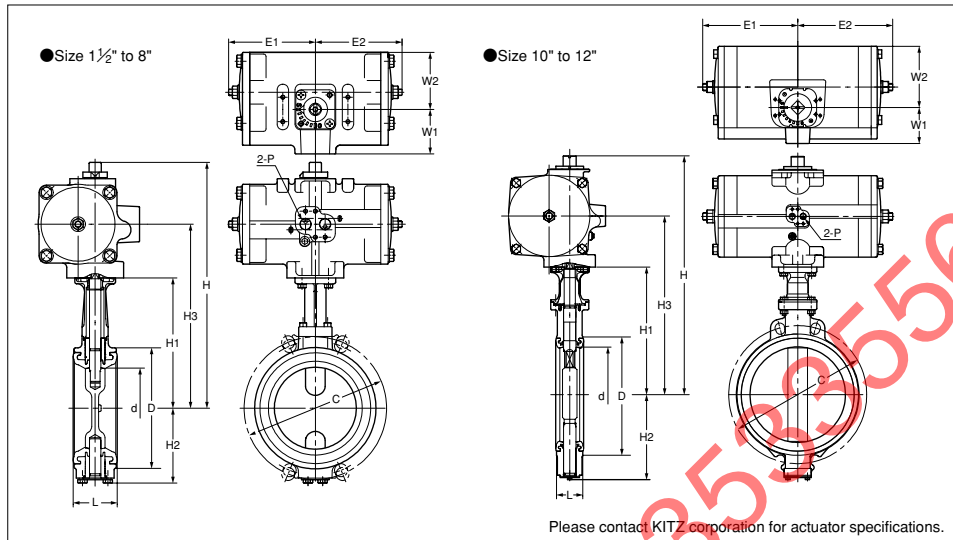

Specification of socket wrench

Valve size : 1½" to 4"	180mm long × 24mm wide (Hexagonal)
Valve size : 5" and 6"	300mm long × 30mm wide (Hexagonal)
Valve size : 8"	600mm long × 30mm wide (Hexagonal)

Pipes Recommended for Use of Butterfly Valves

When butterfly valves are being opened, move of discs may be interrupted by pipe internals. Where butterfly valves are connected with welded pipe flanges shown in the right illustration, use of pipes given in the right table is recommended. Valve-to-flange centering work must be always accurately done on valve mounting on pipe-lines.

Sizes of Lined Steel Pipes

In case of **vinyl chloride lined steel pipes**, sizes of flanges must be larger than the minimum inside diameters given in the right table. In case of pulverulent polyethylene of the pipes lined steel pipes, no special care is needed.

Pipe type		Double welding			Single welding			TS	Minimum Diam of pipe
mm	inch	SGP	Schedule		SGP	Schedule			
			20	40		20	40		
40	1½	●	—	●	●	●	●	●	28

★ Please contact KITZ Corporation when cast iron flanges are used.

Precautions for Trouble-free Operation of KITZ Butterfly Valves

Valve Selection

- 1 Ensure to select a valve with design specifications which meet the fluid type and the pressure and temperature conditions required.
- 2 Lubricants are applied to discs, rubber seats and PTFE seats as standard to protect their surfaces. Oil-free treated types are available as option. Contact KITZ Corporation or its local distributors for the details.
- 3 Contact KITZ Corporation or its local distributors for service with pulverulent bodies.

Storage and Handling

- 1 Valves must be stored in dry, clean and corrosion-free environment with no direct exposure to the sun, leaving valves open by 10° for prevention of permanent distortion of resilient seats. Refrain from overloading valves and their actuators, such as storing them in piles or placing other objects on them.

Mounting on Pipelines

- 1 Valves must be mounted on flanges only after flanges have been welded to pipes and cooled down to the atmospheric temperature. Otherwise, welding heat may affect the quality of resilient seats.
- 2 Edges of welded flanges must be machined for smooth surface finish so that they may not damage resilient seats during valve mounting. Flange faces must be free from damage or deformation, and be cleaned to remove rust or any other foreign objects so that there will be no concern of external leakage through valve and flange connections. Gaskets are not required for mounting KITZ XJ series butterfly valves.
- 3 Clean flanges and pipe bores to thoroughly remove welding spatters, scales and other foreign objects which may have been left inside.
- 4 Accurate centering of each couple of upstream and downstream pipes is essential for trouble-free operation of valves mounted between them. Incorrect centering shown in Fig.1 must be by all means avoided.

Fig.1

- 5 For valve mounting, set jack bolts under the pipes for flat support at the same height, and adjust the flange-to-flange distance so that some 6mm to 10mm room may be allowed beside the both sides of the valve body. Remember that valves here must be left open only by 10 from the fully closed position.
- 6 Set two bolts into the lower mounting guides of a valve and mount it carefully so that flange faces may not damage resilient seats. (Fig.2)
- 7 Then set another two bolts into the upper mounting guides of a valve, ensuring the correct centering between pipes and the valve.
- 8 Trialily open the valve to check to see if there is no disturbing contact between the valve disc and the flanges.
- 9 Remove the jack bolts, set all bolts around the valve body and tighten them alternately and diagonally. Till the flanges contact the valve body (Fig.3). Refer to the table shown below for recommended torque values.

Fig.2

Fig.3

- 10 For mounting actuated valves, provide valve supports to prevent bending of valve necks and reduce valve and pipe vibration.
- 11 Don't step on valve necks or valve hand-wheels.
- 12 Don't mount butterfly valves directly to check valves or pumps, which may cause damage to them by the disc contacts.
- 13 Don't mount valves to downstream sides of elbows, reducers or regulating valves where fluid velocity changes. It is re-recommended to install valves approximately 10 times of the valve nominal sizes away from them for such cases.

- 14 Mount valves taking consideration of the effects which discs are given by fluid velocity or pressure changes in the pipings. Refer to the illustrations. (Fig.4)
Contact KITZ Corporation or its local distributors for the details.

Fig.4

●Mounting to bent pipe

●Mounting to pump outlet

Note:
Centering with centering sleeves is required for the valves coupled with them for accurate centering (Fig.5)
Refer to page 3 for applicable sizes.

Fig.5

Valve Operation

- 1 Valves equipped with manual operators such as levers, handles and gears must be ONLY MANUALLY operated. Application of an excessive external force to operate valves may result in malfunction of valves and their operators.
- 2 Ensure to fully open valves before a loop test of the piping system is carried out with line pressure higher than the nominal pressure of tested valves. Never use closed valves in place of blind flanges.
- 3 When valves need to be dismantled from pipes for maintenance or any other cause, ensure to thoroughly release the line pressure beforehand. Loosening piping bolts under line pressure causes a danger. Any residual fluid left inside the pipeline must be completely drained.
- 4 Users should contact KITZ Corporation or its local distributors for technical advice, when valves should be continuously pressurized while left open by 30° or less.
- 5 Don't use position indicators to operate valves, or overload position indicators. This may cause damage to indicators.
- 6 Ensure to use blind flanges when butterfly valves are mounted at the end of pipelines.
- 7 Standard actuators are referenced in this catalog for actuated valve operation. Contact KITZ Corporation or its local distributors for mounting optional actuators.
- 8 Contact KITZ Corporation for service at hopper or pump outlets.
- 9 Avoid touching gear operators and actuator stopper bolts accidentally.
- 10 It is recommended to perform periodical inspection for
 - Making sure of valve opening degree
 - Checking loosened bolts and leakage at each connection
 - Checking vibration and noise
- 11 Refer to instruction manual for other precautions. Also refer to actuator catalogs and instruction manuals for actuated valves.

⚠ WARNING

Don't disassemble necks while the valve is pressurized to prevent stem blow-out. Also don't dismantle valve operating devices, since it may cause valve discs rotate and result valve malfunction.

CAUTION

Pressure-temperature ratings and other performance data published in this catalog have been developed from our design calculation, in-house testing, field reports provided by our customers and/or published official standards or specifications. They are good only to cover typical applications as a general guideline to users of KITZ products introduced in this catalog.

For any specific application, users are kindly requested to contact KITZ Corporation for technical advice, or to carry out their own study and evaluation for proving suitability of these products to such an application. Failure to follow this request could result in property damage and/or personal injury, for which we shall not be liable.

While this catalog has been compiled with the utmost care, we assume no responsibility for errors, impropriety or inadequacy. Any information provided in this catalog is subject to from-time-to-time change without notice for error rectification, product discontinuation, design modification, new product introduction or any other cause that KITZ Corporation considers necessary. This edition cancels all previous issues.
